

Connected-System and Return-Value Authority

Codex handoff for Bible, Roadmap, architecture, and experience-system updates

Every page should feel like a different use of the same life.

Handoff version	1.0
Prepared	July 20, 2026
Proposed package	PS-GOV-CONNECTED-SYSTEM-001
Runtime impact	Documentation and governance only

Prepared for controlled owner review. Not implementation authorization.

Document map

PURPOSE

This handoff gives Codex exact direction for placing durable connected-system decisions in the Bible while allocating sequence, reusable interaction rules, and logical architecture to the correct companion artifacts.

Section	Content
1-4	Assignment, authority, preservation rules, and executive decision
5	Exact Bible changes by section, including proposed constitutional language
6	High-level architecture map and logical connected-room contracts
7	Prioritized implementation and Roadmap game plan
8	Complete Locked/Open/Later/Tabled/Rejected-current classification
9	Experience-pattern specifications
10-11	Verification, validation, and privacy-safe metrics
12-14	Codex procedure, deliverables, and owner acceptance checklist

Fast decision summary

Disposition	Direction
Do now	Documentation authority; connected-room contract; architecture map; requirements; decision classifications
First implementation candidates	Bounded public connective pilot: Slate Spine, selected Resume Backstories, practice bridges, Studio Return Ticket; requires explicit package assignment
Build next	Canonical relationship/placement foundation through Capture lifecycle, Moment confirmation, Placement, and Use This Moment
After real history	Owner return-value engine, Then and Now, Replay, gentle resurfacing
Later	Focus Themes, Keepsakes, voice delight rituals, Prompt DNA, Signal Cards
On the fence	Companion/worldbuilding, buddy reflection, soft consistency visualization, private circles
Reject now	Hard streaks, guilt, badges, infinite feeds, generic AI rails, auto-publication, copied truth, emotional diagnosis

1. Master assignment to Codex

Create a controlled, owner-reviewable documentation update that incorporates the connected-site and return-value strategy into PeerSlate's governing artifact stack without turning the Bible into a backlog or implying that planned behavior is live.

Produce a candidate PeerSlate Company and Product Bible v2.7 - Connected System and Return-Value Authority. Preserve v2.6 as historical authority until Pete explicitly approves the candidate and the repository pointer chain is updated.

Every page should feel like a different use of the same life.

PeerSlate does not need another global destination. It needs a stronger visible trunk: sources become confirmed records; confirmed records connect by reference to focused rooms; focused rooms reveal truthful origin, relationship, and one best next move; useful outcomes return to the member through memory, preparation, and gentle momentum.

ARTIFACT RULE Durable constitutional decisions belong in the Bible. Sequence belongs in the Roadmap. Reusable interaction behavior belongs in the Experience System. Detailed logical contracts belong in the Architecture and Data Standard. Rationale and supersession belong in the append-only Decision Register.

2. Authority chain and source basis

Use the authoritative repository as the operational source of truth. Before editing, fetch origin/main and read START_HERE.md, CURRENT_BASELINE.yaml, CURRENT_STATE.md, ACTIVE_INITIATIVES.md, the current Bible and Roadmap pointers, and the decision register. Repository truth supersedes this July 20 snapshot if later evidence exists.

Source	Use in this update
Bible v2.6	Member covenant; connected Slate; create-once/place-many; finite Home; navigation; signature experiences; quiet delight; architecture; requirements; metrics; decisions
Roadmap v2.5	Core loop; package sequence; Capture -> Moment -> Placement; Use This Moment; Owner Home; Replay; connected views; release gates
Product & Architecture Brief	Compact authority for one Slate, two modes, trust boundaries, and conservative status language
Technical Architecture & Release State	Runtime/module map, feature gates, and July 20 live/flag-off/default-off truth
Connected-Site Research	Slate Spine, Backstory Drawer, Return Ticket, Then and Now, Focus Themes, Keepsakes, continuation metrics
Voice-First Hooks Research	Tiny-entry loop, soft momentum, memory, personalized prompts, voice usability/delight, social and worldbuilding candidates

3. Non-negotiable preservation and truth rules

- Do not weaken the member-first, private-first, capture-once/connect-many constitution.
- Do not create a top-level destination for hooks, insights, engagement, memories, growth, or AI.
- Do not describe planned, browser-local, flag-off, default-off, or unassigned capabilities as live.
- Do not enable Owner Home, Photo Capture, Projects, database-backed Resume behavior, or any gated capability.
- Do not overload the Bible with low-level schemas, provider choices, or backlog tasks.
- Do not create a second truth store for Resume claims, Story copy, Studio examples, Projects, or return history.
- Do not assume a database table, provider, API, notification channel, or AI model before package definition.
- Do not use addiction, compulsion, guilt, loss, or public performance as product framing.
- Do not change production status under a documentation-only branch.
- Do not make the candidate Bible controlling until explicit owner approval.

4. Executive product decision

The connected-system strategy has three reinforcing layers:

1. Structural continuity: every major room reveals what it is, where material came from, how it relates to the Slate, and the best next move.
2. Canonical continuity: sources, confirmed facts, relationships, interpretations, projections, and outcomes remain distinct but traceable.
3. Temporal continuity: PeerSlate helps the member return to earlier work, see change, continue an unfinished thread, and take a small next action without pressure.

GOVERNING MOVE

Define PeerSlate as focused rooms connected by a visible spine - not a blended dashboard and not isolated page islands.

5. Proposed Bible changes by section

EDITING INSTRUCTION

Insert durable language in the named sections. Keep exact component dimensions, schemas, event names, and implementation mechanics in companion artifacts.

5.1 Executive direction

Add this governing paragraph near the current product focus:

PeerSlate's next coherence objective is not more destinations. It is a stronger visible trunk. Every major room should feel like a focused use of the same member-owned life record. The product shall preserve each room's distinct purpose while revealing truthful origin, authorized relationships, audience or truth state, and one best continuation. Connection is created through canonical references and member-directed actions, not copied facts, generic promotion modules, or a new navigation forest.

Add the sentence: Every page should feel like a different use of the same life.

5.2 Governing product principles

ID	Principle	Decision rule
PS-P-015	Focused rooms, visible spine	Every major room remains focused while showing enough source, relationship, mode, and next-action context that it never feels orphaned.
PS-P-016	Momentum without pressure	Return value may come from useful memory, preparation, gentle prompts, and visible progress, but not guilt, loss framing, punitive recovery, public streaks, or popularity pressure.

Clarify PS-P-009 so that quiet return value explicitly includes resurfaced history, Replay, and one useful next step.

5.3 Product boundaries

Add to PeerSlate is:

- A system that connects rooms sideways by meaning and backward and forward through time.
- A product where a small contribution can compound into future recall, preparation, expression, and decision support.

Add to PeerSlate is not:

- Not a collection of generic related-content rails or promotional cross-links.
- Not a habit game that treats absence as failure.
- Not an emotional-diagnosis system derived from voice, behavior, or inferred mood.

5.4 One connected Slate

The connected-system spine

One connected Slate is not achieved only by sharing a database. The experience must make the relationship visible. Original sources enter a reviewable pipeline; confirmed records connect through governed relationships and exact-version placements; focused rooms receive only authorized context; member actions create reviewable projections or outcomes; and useful history returns through finite Home, Replay, resurfacing, and preparation. Each layer remains separately governed so connection never erases truth boundaries.

Relationship before promotion

Cross-room movement must explain why another room matters in the member's current context. Prefer Practice telling this result, See how this line was earned, or Return to the Moment behind this answer over generic Explore more links.

5.5 Experience model and information architecture

The connected-room contract

1. What is this room helping me do?
2. Whose space and which audience or truth state am I in?
3. Where did this material come from?
4. How does it relate to the larger Slate?
5. What is the one best safe next move?

The same grammar uses different authorized payloads: public mode receives approved public relationships and public-safe source context; owner mode may receive private source relationships, prior work, outcomes, goals, Projects, Replay, and exact audience preview. No private information may be retrieved and hidden in the browser.

Focused but not orphaned

Task rooms such as Studio may reduce chrome while the member answers, records, or reviews. Orientation and continuation appear at natural boundaries rather than interrupting the task. Default connective budget: one primary bridge and no more than two secondary paths.

The temporal spine

When sufficient confirmed history exists, a room may reveal an earlier related Moment, a meaningful change, an unfinished thread, or a future revisit. Temporal cues must be source-linked, dismissible, non-diagnostic, and free of guilt.

5.6 Signature experiences and product ecosystem

Pattern	Constitutional role
Slate Spine	Compact orientation: room role, one or two meaningful relationships, and one primary next action.
Backstory Drawer	Public-safe path from a selected Resume or Work claim to context, impact, related Story/Project, and optional practice.
Studio Return Ticket	Post-review continuation appropriate to public/browser-local or owner persistence truth.
Then and Now	Source-linked temporal comparison showing change, recurrence, or continuity without declaring identity as fact.
Focus Theme	Private optional season-level intention that may tune prompts, resurfacing, Replay, and preparation.
Progress Keepsake	Member-selected reference to an existing quote, clip, pair, Replay item, or projection; not a trophy or duplicate truth.

The return-value engine

Preferred loop: small check-in or Capture -> reviewable value -> finite resurfacing or Replay -> personalized source-linked prompt -> optional next action. Returning after absence is continuation, not failure.

5.7 Voice and modality

Add a durable rule: PeerSlate is expression-first and modality-flexible. Voice and text are first-class paths into the same ownership, provenance, review, correction, privacy, lifecycle, and activation architecture. Voice becomes a signature medium only after it becomes a usable object: editable transcript, clear privacy state, source link, review, correction, retrieval support, deletion, and text fallback. Voice-derived emotional cues may be offered only as humble optional observations, never diagnosis.

Preserve as later voice-delight candidates:

- Walk-and-Talk / Walk Mode
- Story Mode
- Voice-to-Meaning
- Echo Back
- Duet With Your Past Self
- Future Voice Mail
- Audio Subnotes
- Voice Keepsakes
- Private Growth Reels
- Prompt DJ / Conversation Capture

5.8 Design, content, storytelling, and quiet delight

Momentum hooks, not pressure hooks

PeerSlate should make return feel cumulative, warm, and useful. It may acknowledge continuity, preserved threads, reviewed history, and progress. It shall not threaten loss, shame absence, punish missed days, exaggerate praise, or turn professional growth into public performance.

Found detail	Value
Welcome back. Nothing was lost.	Recovery after absence without penalty.
This answer is more specific than the earlier version.	Source-linked improvement without scoring identity.
Same challenge, different season.	Temporal continuity.
This result supports a story you may want to practice.	Relationship-rich continuation.
One small contribution is enough today.	Minimum meaningful action.
This connects to a Focus Theme you chose.	Private purpose continuity.

5.9 Technical direction and architectural constraints

Add a constitutional rule: the connected experience shall use the existing modular monolith through authorized relationship resolution, canonical references, projection services, activation contracts, and temporal-return services. Shared UI components render resolved view models; the browser does not decide ownership, audience, source eligibility, or truth state.

Place the high-level architecture figure in a Bible appendix and the detailed logical contract in the Architecture and Data Standard.

Figure 1. Connected-system architecture: source -> canonical -> relationship -> room -> action -> outcome -> return.

5.10 Top-level mandatory requirements

Candidate ID	Requirement summary
PS-CORE-VAL-005	Return value through useful memory, preparation, reflection, and gentle continuation; no guilt, loss framing, punitive streak recovery, public pressure, or popularity manipulation.
PS-CORE-IA-013	Every primary room identifies role, mode, truth state, permitted source context, and one best next action.
PS-CORE-IA-014	Connected-room components use the same grammar with mode-aware server-authorized payloads; no private client filtering.
PS-CORE-IA-015	Focused task rooms are not interrupted by unrelated promotion; connective actions appear at natural boundaries and default to 1 primary + <=2 secondary.
PS-CORE-IA-016	When confirmed history exists, support finite source-linked temporal continuity without guilt or diagnostic claims.
PS-CORE-FR-009	Eligible deep-room completion provides a truthful continuation or return path appropriate to mode, persistence, and authorized context.
PS-CORE-FR-010	Retained voice Capture uses the text-equivalent review/lifecycle path with editable transcript, privacy/source state, correction, deletion, and fallback.
PS-CORE-DATA-007	Cross-room links and temporal comparisons reference canonical records or exact governed versions; no copied authoritative truth.
PS-CORE-AI-007	Personalized prompts and return suggestions use authorized context, explain material relevance, disclose uncertainty, and support dismissal/correction.
PS-CORE-NFR-008	Connected elements preserve task speed and pass accessibility, responsive, long-content, stale/deleted, restricted, and failure states.
PS-CORE-NFR-009	Measure connected-system and return-value behavior with privacy-safe telemetry and pressure/confusion/overload guardrails.
PS-CORE-GOV-008	Every connective idea has an explicit status; preservation alone never implies implementation authorization.

COLLISION RULE

Codex must inspect the current registry and renumber any proposed ID that collides. Preserve intent and traceability.

5.11 Metrics, learning, and business direction

Measure	Question
Cross-room continuation	Meaningful movement from Resume, Story, Studio, Work, or Home into a related action.
Record reuse	Confirmed records supporting multiple approved placements/projections/actions without copied facts.
First-minute value	One useful result reached quickly.

Measure	Question
Studio loop completion	Answer -> review -> improve/retry -> related next action.
Return after deep-room use	Return following Studio, Resume, Story, or Work use.
Resurfaced-memory continuation	Open, inspect, dismiss, connect, practice, save, or act from Then and Now/Replay.
Voice review	Voice Captures reaching transcript review and confirmation.
Recovery after absence	Useful completion after a missed period without pressure.
Connected-system comprehension	Member can explain how the current room relates to the Slate.

Guardrails: primary-task time must not materially worsen; public/private and live/planned comprehension must not decline; connective elements must not create CTA duplication or visual overload; no private relationship may appear in public payloads; a return mechanic fails if it increases guilt, confusion, or unwanted prompting.

5.12 Decision classification

Add the complete Locked/Open/Later/Tabled/Rejected-current classification from Section 8 of this handoff to Bible Section 19 or a new appendix, with links to the Roadmap and Decision Register.

6. Architecture map and logical contracts

6.1 High-level compounding loop

Layer	Responsibility
1. Original sources	Voice, text, photo, file, and imported context.
2. Review and canonical	Original preserved; proposal reviewed; member-confirmed Moment and canonical objects.
3. Relationship and placement	Exact-version references, provenance, lifecycle, audience, purpose, sensitivity, eligibility.
4. Focused rooms	Journal, Story, Work, Projects, Resume, Studio, Slate, Feed, public/permissioned projections.
5. Activation	Use This Moment, practice, update draft, share, export, connect, select, next step.
6. Outcome and learning	Completion, usefulness, correction, dismissal, contradiction, staleness, revocation, deletion.
7. Return value	Finite Home, resurfacing, Then and Now, Replay, prompt, Focus Theme, revisit.
8. New contribution	The member captures the next Moment because prior contribution became useful.

Cross-cutting: trusted identity; authorization before retrieval; private-by-default; exact audience preview; canonical/interpretation/projection separation; governed AI; accessibility; privacy-safe observability; feature flags; rollout; rollback; deletion propagation.

6.2 Connected-room logical contract

ResolvedRoomContext
- room_id
- room_role
- viewer_mode
- audience_state
- truth_state
- primary_object_reference
- permitted_source_summary
- authorized_relationships[0..2]
- primary_continuation_action
- secondary_actions[0..2]
- optional_temporal_context
- status_or_limitation_copy
- explanation_or_reason

- The resolver receives trusted session identity and route purpose.
- Authorization occurs before data, search, media, cache, or AI retrieval.
- A room may render no connective module when no truthful relationship exists.
- Public mode uses only approved public-safe context.
- Owner mode uses private context only for the current owner.
- Relationship type, audience, source version, lifecycle, and staleness are explicit.
- The UI cannot infer or broaden relationships from labels or client data.
- Each action declares what it uses, what it creates or changes, whether AI is involved, storage, and audience.

6.3 Candidate relationship vocabulary

Candidate relationship	Likely layer
supports Resume claim	Projection support / placement candidate
appears in Story chapter	Projection membership
belongs to Project	Canonical or exact-version Project relationship
demonstrates skill in practice	Governed relationship or interpretation
useful for Studio/Moment Lab	Activation eligibility
links to source	Provenance
changed from earlier Moment	Temporal interpretation with support
influenced outcome	Canonical relationship or member-confirmed link
continues unfinished thread	Temporal/action candidate
appropriate for audience/purpose	Projection or authorization metadata
selected as Keepsake	Member-selected reference

NO SCHEMA COMMITMENT	The Bible may preserve vocabulary and rules. The Architecture and Data Standard determines which relationships are canonical, placement, projection, interpretation, or operational after repository and data-model review.
-----------------------------	---

6.4 No new system of record

The proof graph is not a separate product or database truth. It is the governed relationship and placement capability emerging from the canonical Slate. Make it an explicit acceptance outcome of PS-PLACEMENT-001 and later connected-view packages.

7. Prioritized implementation and Roadmap game plan

STATUS RULE This section recommends Roadmap placement. It does not authorize runtime work. Every implementation candidate remains unassigned until an owner-approved initiative package says otherwise.

Priority 0 - Do now: documentation and authority synchronization

1. Create candidate Bible v2.7 with the durable language in this handoff.
2. Update a candidate Roadmap revision without changing live statuses.
3. Add the high-level architecture map to the Bible appendix and the detailed contract to the Architecture and Data Standard.
4. Add the six canonical patterns to the Experience System.
5. Add an append-only Decision Register entry.
6. Create a research -> principle/requirement -> phase/package -> artifact traceability crosswalk.

Priority 1 - First bounded implementation candidates after assignment

A. Public connectedness pilot

Recommended candidate package: PS-PUBLIC-CONNECTIVE-001.

Scope:

- Slate Spine/connected-room orientation on selected public Resume, Story, and Studio states.
- Three to five Resume Backstory Drawers for anchor achievements.
- Practice telling this bridges to the exact live Studio behavior.
- Public-safe Behind this answer context where support already exists.
- Post-review Studio Return Ticket appropriate to public/browser-local truth.

Out of scope:

- Account-backed Studio history or private Journal history.
- New persistence or unapproved schema.
- Broad public redesign.
- Generic related-content rails.
- More than one primary and two secondary actions.

Entry gate: current route/package confirmation, accepted production-intent mockups, public-safe relationships, and explicit owner assignment.

B. Homepage Interview convergence

Keep the recognized homepage convergence as a separate bounded package. It maps the accepted homepage walkthrough to the exact live Studio without changing Studio behavior or implying private history.

C. Shared connective component foundation

After the public pilot is approved, create one reusable server-rendered/Jinja-compatible component that receives resolved authorized view models. Templates and browser JavaScript must not query arbitrary private context or infer ownership.

Priority 2 - Build next: canonical relationship foundation

Package	Connected-system outcome
PS-CAPTURE-002	Lifecycle, correction, original preservation, archive/delete/export propagation.
PS-MOMENT-001	Member-confirmed canonical Moment boundary.
PS-PLACEMENT-001	Exact-version create-once/place-many references and proof-graph outcome.
PS-ACTION-CORE-001	Action eligibility/source/output/audience/lifecycle contract.
PS-ACTION-STUDIO-001	Practice handoff using permitted canonical context.

- Correction/deletion/revocation/audience changes propagate.
- Relationships never grant access by themselves.
- Relationship labels derive from governed types, not copied prose.
- Rooms request authorized context through shared services.
- Public and owner payloads use the same grammar with different permitted context.

Priority 3 - After Owner Home frontend and real history

Private return-value engine

Recommended candidate package: PS-RETURN-VALUE-001 or a bounded extension of Owner Home/Replay.

- One obvious Capture action.
- One small prompt or check-in.
- One recent and one resurfaced Moment.
- One concise source-linked observation when warranted.
- One next step.
- Welcome-back behavior after absence with no loss framing.

DO NOT START WITH A STREAK METER Validate memory, usefulness, and one clear next action first.

Then and Now and Replay

Implement Then and Now as a Home/Story/Studio/Replay pattern only after confirmed history, source authorization, contradiction handling, and correction behavior are mature. Replay remains a finite narrative - movement, a few Moments, missing context, and one next action - not a score dashboard.

Priority 4 - Later experiments after the return loop is proven

- Focus Themes as a private cross-room overlay.
- Progress Keepsakes as references, not copied records or a new top-level destination.
- Voice delight rituals after transcript, review, privacy, retention, and failure behavior are proven.
- Future Voice Mail, Duet With Your Past Self, Voice Keepsakes, private growth reels.
- Prompt DNA and Signal Cards after sufficient history and model-governance evidence.
- Optional challenge-free journeys with no failure state.

Priority 5 - On-the-fence / preserve for evaluation

- Companion or worldbuilding layer.
- Private constellation, archive, path, room, garden, or trail that evolves.

- Buddy Reflection or trusted-person accountability.
- Small private circles or prompt swaps.
- Soft consistency visualization.
- Future-self messages, soundscapes, and celebration readback.

Each requires a specific hypothesis, prototype, trust review, and evidence that it strengthens the private owner loop without infantilization, distraction, privacy burden, or engagement pressure.

8. Complete decision classification

8.1 Locked / Current direction

- Every page should feel like a different use of the same life.
- Stronger trunk, not more branches.
- Focused rooms connected by a visible spine.
- Create once, place many through canonical references.
- Same interaction grammar, mode-aware authorized payload.
- One best bridge, no wall of recommendations.
- Relationship before promotion.
- Temporal continuity through memory, Replay, and useful next steps.
- Momentum hooks, not pressure hooks.
- Expression-first, modality-flexible voice and text parity.
- Return value is private-first, source-linked, finite, dismissible, and non-diagnostic.
- Proof graph is an outcome of canonical placement, not a new truth store.

8.2 Open decisions

- Exact visual form and canonical name of Slate Spine.
- Whether the first public pilot is new or amends existing Resume/Studio packages.
- Which three to five Resume achievements receive Backstory Drawers.
- Curated configuration versus projection-backed public Studio support.
- Exact owner Return Ticket actions and storage.
- Replay cadence and user controls.
- Fixed, member-authored, AI-suggested, or hybrid Focus Themes.
- Keepsake home: Replay, My Slate, Story, or private collection.
- Whether soft consistency can remain useful without becoming a streak.
- Notification policy, channels, timing, and opt-in defaults.
- Raw-audio retention and voice-processing disclosures.

8.3 Later

- Then and Now across Home, Story, Studio, and Work.
- Focus Themes.
- Progress Keepsakes.
- Prompt DNA and Signal Cards.
- Guided journeys or challenge-free challenges.
- Future Me messages.
- Voice-native rituals.
- Companion/worldbuilding prototype after retention is measured.
- Buddy Reflection after the two-person trust loop.

8.4 Tabled / on-the-fence

- Literal pet companion.
- Garden, constellation, path, room, studio, or archive that grows.
- Public or connection-visible consistency.
- Social accountability beyond one trusted person.

- Private circles, prompt swaps, or shared themes.
- Mood Soundprint or prosody visualization.
- Celebration readback and ambient soundscape rituals.

STATUS MEANING	Tabled means preserved for reconsideration, not authorized for design, architecture, build, or release.
-------------------	--

8.5 Rejected for the current program

Rejected-current idea	Reason
Hard/loss-framed streaks	Conflicts with member benefit and no-pressure covenant.
Points, badges, levels, public counts	Turns growth into performance and external reward.
Confetti as default reward	Weakens calm professional tone.
Guilt reminders or punitive recovery	Treats absence as failure.
Infinite feeds, trends, popularity ranking	Engagement-casino architecture.
Generic Explore more rails	Promotion without relationship or information scent.
Universal AI sidebar / global Insights page	Creates another disconnected destination.
Automatic Resume/Story/Project/Feed publication	Violates agency and publication boundaries.
Room-specific copied facts	Creates conflicting systems of truth.
Emotional diagnosis from voice	Overclaims inference and creates sensitive trust risk.
Indefinite raw-audio retention	Unnecessary privacy and security exposure.
Fabricated people, counts, history, insights	Violates status and truth rules.
Enable disabled features through docs	Documentation is not release authorization.
Broad public redesign before gate	Displaces owner-loop and trust priorities.
Social mechanics before owner value	Uses other people to compensate for incomplete core utility.
Projects task-management expansion	Violates the Projects covenant.

9. Experience-pattern specifications

9.1 Slate Spine

Purpose: orient a user inside a focused room without creating another navigation bar.

- Room role in one concise line.
- Viewer/audience or truth label when material.
- Zero to two meaningful relationships.
- One dominant next action.
- Optional status or limitation statement.

Placement: near the hero or primary content header; compact on mobile; never competing with the room's primary task.

Required states: public approved relationship, owner private relationship, no relationship, deleted/unavailable source, unavailable/Coming later action, browser-local limitation, restricted audience, and AI unavailable.

9.2 Resume Backstory Drawer

- Use only for three to five anchor claims initially.
- Show claim, context/contribution/outcome, related Project or Story, optional Practice telling this, and public-appropriate source language.
- Public-safe only; no raw private Journal, owner notes, or source files.
- Progressive depth, not default bulk.
- Practice route must preserve exact live Studio truth.

9.3 Studio Return Ticket

Trigger only after meaningful progress such as Review or Improve.

Mode	Candidate actions
Public/browser-local	Primary: reconnect to approved work behind answer. Secondary: related question. Secondary: review local attempt where supported.
Owner future	Save what changed; connect to confirmed Moment/Project; try again later with source-linked variation; compare authorized history.

- Never interrupt the active answer flow.
- Never claim server persistence in browser-local mode.
- Never save, connect, or schedule without explicit action.

9.4 Then and Now

Inputs: at least two authorized source-linked records, a deterministic time/relationship basis, and optional AI wording only after sources are established.

- Same challenge, different season.
- You described this differently six months ago.
- This explanation contains more specific context than the earlier version.
- An earlier decision contributed to this outcome.

Controls: inspect sources, not related, too personal, not useful, dismiss, correct relationship, and Use This Moment.

9.5 Focus Themes

A Focus Theme is an optional private overlay, not a destination or identity label.

- Explain my work clearly.
- Practice calm confidence.
- Reclaim momentum.
- Prepare for a leadership transition.
- Make technical contribution visible.
- Build toward a chosen learning goal.

It may tune prompts, resurfacing, Replay, Studio question selection, and one next step. It may not silently filter out other history, define the person, or become public without projection.

9.6 Progress Keepsakes

A Keepsake is a reference to an existing authorized object or projection.

- Strongest interview clip.
- Exact human sentence.
- Confirmed Resume claim.
- Before-and-now pair.

- Replay Moment.
- Story chapter.
- Meaningful Project outcome.
- No copied authoritative text as new truth.
- No points, rarity, ranking, or public trophy behavior.
- Deleting or revoking the source updates or removes the Keepsake.

10. Verification and validation plan

10.1 Verification

- Route and payload tests for owner, selected person, connection, member, and public.
- Cross-user negative tests and no-client-filtering evidence.
- Exact-version reference and no-content-copy tests.
- Deleted, revoked, stale, restricted, and unavailable source behavior.
- AI unsupported-claim and provider-outage behavior.
- Browser-local versus server-persistent truth tests.
- Mobile, keyboard, screen reader, 200% zoom, reduced motion, long content, empty, error, retry.
- Privacy-safe telemetry with no content leakage.
- Visual comparison to named authority.
- Rollback and feature-flag behavior where applicable.

10.2 Validation scenarios

Scenario	Pass condition
Public Resume -> Backstory	Visitor understands relation to Story/Studio and sees no private material.
Public Studio Return Ticket	User sees truthful continuation without account-backed persistence claims.
Owner mode parity	Same grammar, private authorized payload, clear audience result.
Two-owner isolation	Pete and Danielle cannot retrieve each other's private relationships, prompts, history, or Returns.
Deletion/revocation	Downstream connection modules and Keepsakes update according to policy.
Dismissal	User ignores resurfacing with no pressure.
Return after absence	User completes one useful action with no loss language.
Comprehension	User explains how the current room relates to the Slate.
Task speed	Primary task is at least as fast as before.
Provider failure	Essential room, source inspection, and safe next action remain usable.

11. Privacy-safe measurement taxonomy

Candidate event names; do not log content:

- connected_room_context_rendered
- connected_room_primary_action_selected
- connected_room_secondary_action_selected
- resume_backstory_opened

- resume_practice_bridge_started
- studio_return_ticket_rendered
- studio_return_ticket_selected
- resurfaced_moment_opened
- resurfaced_moment_dismissed
- then_and_now_inspected
- focus_theme_selected
- keepsake_reference_added
- voice_capture_review_started
- voice_capture_confirmed
- return_after_absence_completed

Allowed dimensions: route family, audience mode, component version, action type, feature flag, success/failure, latency bucket, and source-state category. Prohibited: names, titles, transcript or answer text, private IDs, source snippets, relationship content, or AI prompts.

12. Codex execution procedure

1. Fetch and verify origin/main; never work from a stale local branch.
2. Read the complete authority chain and active initiatives.
3. Create docs/connected-system-return-value-authority.
4. Create PS-GOV-CONNECTED-SYSTEM-001 using the repository package standard.
5. Preserve current Bible and Roadmap files as historical versions.
6. Produce candidate Bible v2.7 and candidate Roadmap with PROPOSED status.
7. Update Architecture and Data Standard and Experience System rather than overloading the Bible.
8. Add Decision Register entry and source crosswalk.
9. Update TOC, document map, version notes, appendices, references, page numbers, and captions.
10. Run documentation checks, link checks, render/export, and visual review; fix clipping, orphan headings, unreadable diagrams, and stale footers.
11. Produce a file-by-file diff and disposition matrix.
12. Do not change controlling pointers or current-state claims until Pete approves.
13. After approval, perform a separate authority activation update; this still enables no runtime feature.

13. Required deliverables from Codex

- Candidate PeerSlate_Company_and_Product_Bible_v2.7.docx and repository source.
- Candidate Roadmap revision with priority/package crosswalk.
- Updated Architecture and Data Standard with contract and detailed diagram.
- Updated Experience System with six canonical patterns and states.
- PS-GOV-CONNECTED-SYSTEM-001 initiative package.
- Decision Register entry.
- Traceability matrix.
- Source preservation and supersession record.
- Rendered owner-review artifact if required by repository standard.
- Change report listing exact sections, rationale, open decisions, and deferrals.

14. Owner acceptance checklist

Acceptance area	Pass question
Stronger trunk	Bible clearly says stronger trunk, not more branches.

Acceptance area	Pass question
Connection rule	Every major page has a governing connection rule without losing distinct purpose.
Modes	Public and owner modes are unmistakable.
Proof graph	Canonical placement/references, not a new truth store.
Priority bands	Backstory, Return Ticket, Then and Now, Themes, Keepsakes, voice ideas are classified.
Preserved candidates	Worldbuilding and buddy concepts are preserved without authorization.
Rejected-current	Hard streaks, guilt, badges, infinite feeds, generic AI rails, auto-publication are explicit.
Architecture	Map shows source -> canonical -> relationship -> room -> action -> outcome -> return.
Requirements	New shall statements are measurable and traceable.
Status truth	Roadmap preserves current release truth and gates.
Authority	Candidate remains non-controlling until approval.
Finish	Document is professionally rendered and consistent with the Bible visual system.

15. Final governing summary

Capture something real once. Preserve what is true. Connect it by reference. Use it in a focused room. Return later to see what changed and take one worthwhile next step.

PeerSlate should not make people return because they fear losing progress. It should make them return because their prior work became useful, meaningful, and easier to carry forward.

Appendix A. Source-reference map

Reference	Relevant authority
Bible v2.6, pp. 8-16	Mission, category, principles, connected Slate, modes, finite Home, signature experiences.
Bible v2.6, pp. 19-23	Community culture, quiet delight, storytelling, architecture rules.
Bible v2.6, pp. 26-33	Requirements, metrics, governance, vocabulary, decisions.
Bible v2.6, Appendix H	Approved owner visual boards showing connected Home, Capture, Journal/My Slate, Story/Resume, Studio/Moment Lab.
Roadmap v2.5, pp. 9-13	Core loop, architecture, data layers, phase map.
Roadmap v2.5, pp. 24-36	Capture, voice, Use This Moment, Replay, connected views.
Roadmap v2.5, pp. 47-50	Immediate execution plan and status worksheet.
Connected-Site Research, pp. 6-16	Spine, patterns, priority packages, metrics, clutter controls.
Voice-First Hooks Research, pp. 4-16	Hook families, modality, return loop, voice concepts, priority bands.
Technical Release State, pp. 1-4	Runtime, gates, release truth, safe next work.

Appendix B. Codex change-report template

Report field	Required content
Files and versions	List every created, modified, preserved, and superseded artifact with status before/after.
Constitutional changes	Identify exact Bible sections, new principles, requirements, vocabulary, and decision classifications.
Companion changes	Summarize Roadmap, Architecture/Data Standard, Experience System, initiative, and Decision Register updates.
Truth and scope checks	Confirm no runtime status, feature flag, route, schema, deployment, or capability claim changed.
Open decisions and owner gate	List unresolved choices, recommended decisions, render evidence, and the exact approval needed to activate authority.
